

Maeotias inexpectata

Black Sea jellyfish

Threat Scores

1. Ecological Impact
 - The medusae eat larvae of an introduced mud crab, *Rhithropanopeus harrisi* (Mills and Sommer 1995)
 - Dense populations of this jelly can alter estuarine food webs
 - The prey of this jelly includes small adult crustaceans and larvae, so local populations of crabs and their relatives could be diminished
2. Invasive Potential
 - Know to be transported and discharged from ballast water
 - Tolerant of brackish and low salinity environments
 - Spread from original ports of entry into estuaries and river systems
3. Geographic Extent
 - Locally patchy
4. Management Difficulty
 - No effective eradication methods

Geography and Habitat

1. Native: Black Sea
2. Introduced: Atlantic Coast of United States, California
3. Habitats
 - Marine, brackish water, estuaries/bays

Invasion Pathways

1. Ballast water and sediments

Non-Native Locations

1. 41- Virginian
2. 42- Carolinian
3. 58- N. California
